Search Notes

Daniel,

Due to seq. length, unable to search amino acid query. I did, however, search Seq. ID 1 in the AA dBs.

Beverly

Search Request 09914191

Please search for the following in the commercial and issued patent databases:

-a nucleic acid comprising SEQ ID NO:1

Also, I have reason to believe that the reverse complement of SEQ ID NO:1 encodes all or a portion of the following amino acid sequence:

MTHVASQFASSYVFYWRDYFEDQPLLYPPGFDGRVVVYPSNQTLKDYLSWRQADCHINNLYNTVFW ALIQQSGLTPVQAQGRLQGTLAADKNEILFSEFNINYNNELPMYRKGTVLIWQKVDEVMTKEIKLPTE MEGKKMAVTRTRTKPVPLHCDIIGDAFWKEHPEILDEDS

would it be possible to search this amino acid sequence against the commercial and issued patent databases as well?

Thanks, Dan

Daniel M. Sullivan Examiner AU 1636 Room: 12D12 Mail Box: 11E12 Tel: 703-305-4448

                                                                                            RESULT
                                                                                                                                              ò
                                                                                                                                                                                                                                                                        The present invention describes primer sets for synthesising 5602 (111-length cDNAs defined in the specification. Where a primer set compises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide comprises at least 15 nucleotides, or (b) a combination of an oligonucleotide comprises a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprises a 3'-end sequence, where the oligonucleotide which comprises a 3'-end sequence, where the oligonucleotide which comprises a 3'-end sequence, where the combination of the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the price control and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers are also useful for the full-length cDNAs. The primers are also useful for AMH13628 and AMH13631 to AMH3631 represent human cDNA sequences; AMB92446 to AMH3632 crepresent human amino acid sequences; AMB92446 to AMH3632 crepresent in the present in the exemplification of the present enead in the exemplification of the present enead in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   109

The invention relates to human nucleic acids (AAIS7798-AAI61169) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypucleotide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the Activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer disgnosis and therapy, drug screening, as assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               assays for receptor activity, arthritis and initalmination, revocation C.N.S disorders.

The present invention describes primer sets for synthesising 5602

(ull-length cDNAs defined in the specification. Where a primer set
comprises: (a) an oligo-dT primer and an oligounclectide complementary
to the complementary strand of a polynuclectide which comprises one of
the 5602 nuclectide sequences defined in the specification, where the
oligonuclectide comprises at least 15 nuclectides; or (b) a combination
of an oligonuclectide comprising a sequence complementary to the
complementary strand of a polynuclectide which comprises a 5'-end
sequence and an oligonuclectide comprises a 3'-end sequence complementary to the
complementary strand of a polynuclectide which comprises a 1'-end sequence to sequence complementary to a
polynuclectide which comprises a 3'-end sequence to sequence therefore
the 5'-end sequence/3'-end sequence is selected from those defined in
the 5'-end sequence/3'-end sequence is selected from those defined in
in gene therapy. The primers are useful for synthesising polynuclectides,
particularly full-length cDNAs. The primers are also useful for the
detection and/or diagnosis of the abnormality of the proteins encoded by
the full-length cDNAs. The primers allow obtaining of the full-length
cDNAs easily without any specialised methods. AAH0316 to AAH13628 and
AAH13633 to AAH18742 represent human cDNA sequences;

AAH13633 to AAH18742 represent human cDNA sequences;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           479

                                                                                                    AAH32943 to AAH31195 and AAG73514 to AAG77788 represent human colon cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient of genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated PB, by inserting the nucleic acids into a host cell and culturing the cell cancer and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 present invention.

the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polymucleotides are useful in gene therapy. A composition containing a polypeptide or polymucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Auntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence data for this patent did not form part of the printed

                                                                                                                                                                                                                                                                                                                                                                                                                  205
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CTGCCAACAGAAATGGAAGGAAAAAAATGGCAGTGACCCGGACCAGGACAAAGCCAGTG 356
capable of detecting 1000 or more genes from Drosophila. The invention i useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL20511), expressed DNA sequences (ABL50175) and the encoded proteins (ABB57777-ABP27072).

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CAATCTGGACTAACACCCAGGTACAAGGCAAGGGAGATTACAGGGAACTCTTNCAGCAGAC

```
The invention relates to identifying target proteins (ABB90790-ABB94016) for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms using suitable search parameters, where plant sequences having an B-value sequences are actor of 3 than the E-value of most similar non-plant sequences are selected. The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are useful as herbicides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CCAACACCGCAAACAAGGTGTTCTGCTTAAACAGAGTAAGATACACCACCCCGTTCCATC 133

The differentiation enhancing factors (DEF), comprise at least one each of SH3 consensus binding sequence, ankyrin repeat, pleckstrin homology domain and C2 domain. The DEF induce adipogenesis or neurogenesis; they are mediators of SH3-domain dependent signalling and may be involved in cellular gene expression, cytoskeletal architecture, protein trafficking, endocytosis or adheshon, migration, proliferation and differentiation of cells. Typical applications of DEF and agents that modulate cells or expressing them, are treatment of hyperplastic and neoplastic disease (a wide range of solid tumours and leukaemias), including metastases; for in vitro induction of differentiation of neural crest cells to neurons, of plaid cells etc.; for increasing neuron survival, and inducing cell repair, in the nervous system (e.g. treatment of traummatic injury, stroke, Alzheimer's, Parkinson's or Huntington's diseases, amylotrophic lateral sclerosis, multiple sclerosis etc.).
                                                                                                                                                                                                                                                                                                                                                                                                                                                       Zebrafish, differentiation enhancing factor, ankyrin repeat, C2 domain, SH3 consensus binding sequence; pleckstrin homology domain; adipogenesis; neurogenesis; hyperplastic disease; neoplastic disease; nervous system.

Patent No. 6143561

GENERAL INFORMATION:

APPLICANT: Randall, Douglas D.

APPLICANT: Monston, Mark L.

APPLICANT: Money, Brian A.

APPLICANT: Meerly, Jan A.

APPLICANT: Money, Brian P.

TITLE OF INVENTION: BRANCHED CHAIN OXOACID DEHYDROGENASE AND

TITLE OF INVENTION: BRANCHED CHAIN OXOACID DEHYDROGENASE AND

TITLE OF INVENTION: BRANCHED CHAIN OXOACID DEHYDROGENASE TOO

TITLE OF INVENTION: BRANCHED CHAIN OXOACID DEHYDROGENASE OF THE REFERENCE: US/09/108,020A

TITLE OF INVENTION: BRANCHED CHAIN OXOACID DEHYDROGENASE OURRENT APPLICATION NUMBER: 60/051,291

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Description

Phosphoribosylamidoimidazole-succinocarboxamide synthase (EC 6.3.2.6)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gene 263:159-169(2001).
-!- CATALYTIC ACTIVITY: ATP + 5-amino-1-(5-phospho-D-
ilbosyllimidazole-4-carboxylate + L-aspartate = ADP + phosphate
($\sigma^2 - 2 - 15 - amino-1-(5-phospho-D-ribosyl) imidazole-4-
carboxamido]succinate.
-!- PATHWAY: De novo purine biosynthesis; seventh step.
-!- SIMILARITY: BELONGS TO THE SAICAR SYNTHETASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Eukaryota; Fungi; Ascomycota; Saccharomycotina; Saccharomycetes; Saccharomycetaceae; Pichia.
